How to set up Sticky Clash

A projector, a webcam and a wall. Set them up properly once. After that the game sets itself up, and keeps itself right every minute.

The first time takes about ten minutes. This guide online: noaquim.github.io/sticky-clash/uitleg.html

GETTING READY

0 What you need

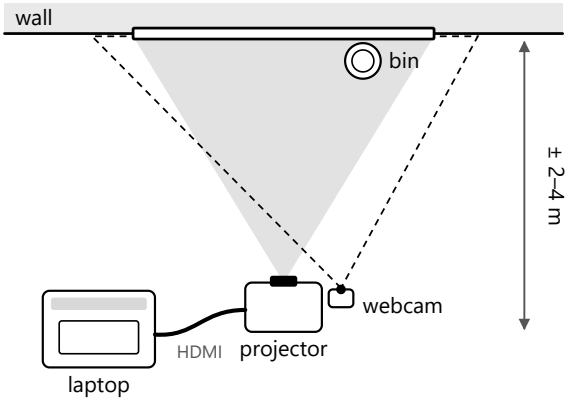

- [ ] A laptop or computer
- [ ] A webcam, or your phone as a webcam (free app: DroidCam or Camo)
- [ ] A bucket, waste bin or box: that's the bin
- [ ] A projector and an HDMI cable
- [ ] A plain, light-coloured wall
- [ ] Sticky notes or other things: books, small boxes, a ruler

> Chrome or Edge works best. Firefox and Safari work too.

1 Set up the projector

1. Put the projector straight in front of the wall, on a table or cabinet.
2. Turn it on.
3. Make the picture sharp with the focus ring.
4. Bigger picture? Move the projector further back.
5. Dim the lights. Twilight is best.

> Not pitch-dark: then the camera can't see colours well. And no sun or bright window on the wall.

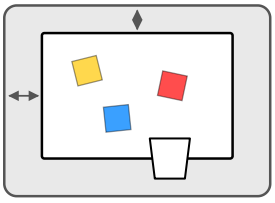

Seen from above. Grey: the projector's light. Dotted line: what the webcam sees.

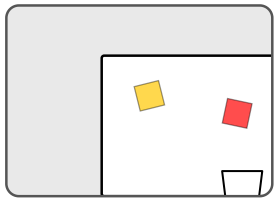

2 Set up the webcam

1. Put the webcam next to or on top of the projector.
2. Point it at the wall.
3. It must see the whole picture, with a strip of wall around it.
4. Tape it down.

> Does it shift a little later on? No problem: the game sets itself up again. Your laptop's own camera won't do: it looks at you, not at the wall.

✓ Good: the whole picture, with a strip of wall around it.

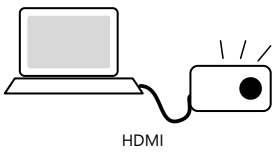

✗ Wrong: part of the picture is cut off.

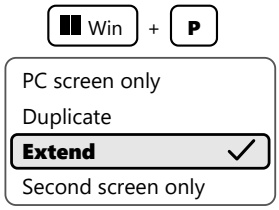

3 Connect the laptop

1. Plug the HDMI cable into the laptop and the projector.
2. Set the second screen to **Extend**, not Duplicate:
   - Windows: Win + P → **Extend**
   - Mac: System Settings → Displays → use as **extended display**
   - Chromebook: Settings → Displays → untick **Mirror built-in display**
   - Linux: Settings → Displays → **Join Displays**

> Now the panel stays on your laptop, and the game will soon be on the wall.

HDMI cable from laptop to projector.

Windows: Win + P → Extend.

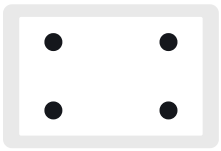

4 Open the game

1. Open the game in one of these ways:
   - the **Sticky Clash** shortcut on the desktop
   - from a USB stick: open the folder and double-click **sticky-clash.html**
   - from the zip: unzip it first, then double-click **sticky-clash.html**
   - online: noaquim.github.io/sticky-clash

5 Choose Wall + projector

1. On the welcome card, click **Wall + projector**: the game now walks you through it step by step, and each step shows a green tick once it worked. Been here before? Then click **Start: set everything up**, or **Set up step by step**.
2. Does the browser ask for the camera or the screens? Click **Allow**.
3. Follow the seven steps: connect the projector, projector window on the projector, aim the camera, calibrate, learn the wall, place the bin, done. Rather do it all in one go? Click **All automatic** on the card: then the game does everything itself.
4. Does the wall say **Now place the bin**? Put it down and step aside again (see step 6).

> **Projector window on your laptop?** (Firefox, Safari) Follow the orange box in the panel: drag it to the projector and click in it. Already in place? Click **Continue**. **Notes already on the wall?** Leave them: the game finds those too.

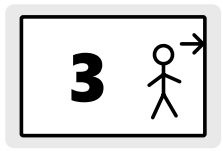

White area and dots: calibrating

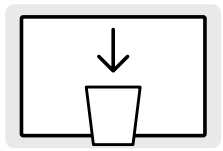

A green border around the picture

Grey light: setting the wall light

"Step out of view": learning the wall

"Now place the bin": finding the bin

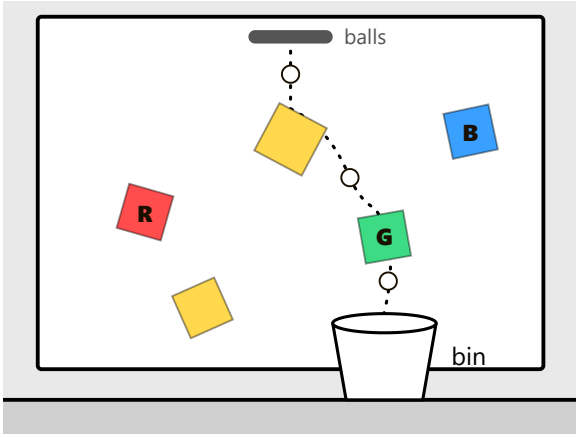

All set: start the round

6 The bin

1. Put a bucket or box at the bottom against the wall, with its opening inside the picture.
2. Picture doesn't reach the floor? Put the bin on a chair or stool.
3. Do it when the wall says **Now place the bin**. Earlier is fine too.

> **No bin?** Then you play with the bin drawn on the wall. Drag it with the mouse in the play field on your laptop.

The bin at the bottom, its opening in the picture. Notes at an angle above it. R = red, G = green, B = blue.

7 Stick on notes

1. Stick notes on the wall at an angle, like a marble run to the bin.
2. Any colour works. Books, small boxes or a ruler too.
3. Special colours: **red** = trampoline, **green** = turbo, **blue** = breaks after 5 hits.

> The special colours only work with enough light. Too dark? Then the game turns the **Wall light** up by itself. If that doesn't help, they count as ordinary notes and the wall says **Too dark for colours: special notes are ordinary now**. Turning on a lamp helps. Your hands never count, and neither do people. An object in your hand does.

PLAYING

8 Start a round

1. Click **Start round**. The wall counts down: 3, 2, 1.
2. Steer the balls into the bin with your notes.
3. Feel free to move notes while you play.

> **Handy:** click **Connect phone** and scan the QR code. Then you start and pause from your phone. Space = pause, and after the round a new round.

9 Leave it on

1. Leave **Check every minute** (at the top of the panel) on. It already is.
2. Just keep playing. Every minute, the game checks whether the light or the wall has changed.
3. Something changed? Then it adjusts by itself after the round. Step aside until the wall says **Light and wall adjusted**.

> Playing with no time limit? Then the game takes a short pause for it by itself. If detection really breaks (the light goes off), it pauses right away and then plays on by itself. Your notes keep counting. Camera or projector moved? Then it sets everything up again by itself.

HELP

10 Not working?

The camera isn't found

→ Click **Allow**, or the camera icon in the address bar.
→ Close Teams, Zoom or the Camera app. Plug the webcam in again.

Nothing is detected

→ More light, or set **Wall light** higher (under Play mode).
→ Set **Sensitivity** higher.

Colours are wrong in the dark

→ Turn on a lamp, or set **Wall light** higher.
→ Or play without: red, green and blue then count as ordinary notes.

The projector window is on the wrong screen

→ Drag it to the projector (Windows: Win + Shift + →) and click in it.
→ Does the wall show the same as your laptop? Win + P → Extend (step 3).

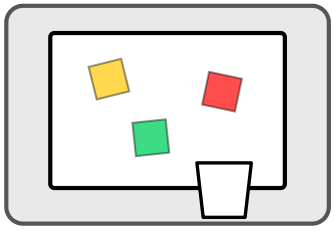

Everything is detected: the whole wall lights up

→ Step out of view and wait: the game adjusts by itself. If not: click **Set up again**.
→ Set **Sensitivity** lower.

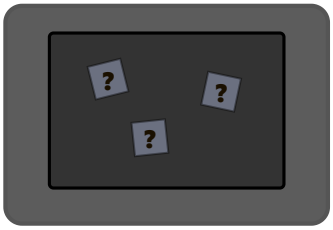

The picture isn't sharp

→ Turn the projector's focus ring.
→ Slanted picture? Put the projector straight in front of the wall, or use the keystone button.

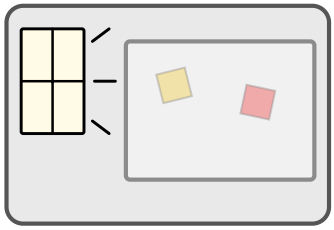

> **Still not working?** Click **Photo of what the camera sees** and send that photo: it shows exactly what's going on.

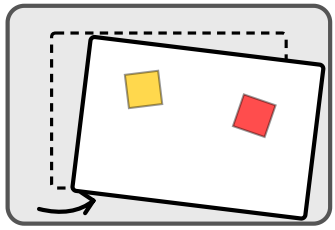

✓ Good: twilight, a plain wall.

✗ Too dark: colours disappear. Turn on a lamp.

✗ Bright window or sun in view: close the curtains.

✗ Camera moved: tape it down. The game sets itself up again.

+ No projector: on a screen

1. Choose **Screen, no projector**.
2. Put the webcam above a table, or facing a wall or board.
3. Keep your hands out of view while the game learns the empty surface.
4. Put down notes or things. You play on your screen.

+ No camera: the demo

1. Choose **Try it without a camera**.
2. Drag the notes with your mouse or finger, or draw new ones.
3. Works on a phone or tablet too. Nothing to install.
